# INTRODUCTION TO LATTICE GAUGE THEORIES

[ Ovviamente da scrivere ]

### 1.1 REVIEW OF YANG-MILLS THEORY

[ Ovviamente da riscrivere ]. A Yang-Mills theory is a gauge field theory on Minkowski space  $\mathbb{R}^{1,d}$ , where the gauge group  $U(1)$  or  $SU(N)$ , with matter fields, which are defined by a representation of the gauge group. For example, *Quantum Chromodynamics* (QCD) is an  $SU(3)$  gauge theory with Dirac spinors in the fundamental representation. Keeping in mind the example of QCD, the Lagrangian of the theory is

$$\mathcal{L} = -\frac{1}{2g^2} \text{tr}(F_{\mu\nu}F^{\mu\nu}) + \bar{\psi}(i\gamma^\mu D_\mu - m)\psi, \quad (1.1)$$

where the fermions  $\psi$  are taken in the fundamental representation of  $SU(N)$  and the covariant derivative is  $D_\mu = \partial_\mu - iA_\mu$ . We choose the convention where the Lie algebra generators  $T^a$  are Hermitian and  $[T^a, T^b] = if^{abc}T^c$ , with real structure constants  $f^{abc}$ . Furthermore, the generators are such that  $\text{tr}(T^a T^b) = \frac{1}{2}\delta^{ab}$ . The strength-field tensor  $F_{\mu\nu}$  is given by

$$F_{\mu\nu} = \partial_\mu A_\nu - \partial_\nu A_\mu - i[A_\mu, A_\nu] \quad (1.2)$$

and transforms in the adjoint representation of  $SU(N)$ . Both the gauge field  $A_\mu$  and the curvature tensor  $F_{\mu\nu}$  live in the Lie algebra  $\mathfrak{su}(N)$ .

Under a gauge transformation given by a group-valued function  $g(x) \in SU(N)$ , such that  $\psi \mapsto g(x)\psi(x)$ , then

$$A_\mu(x) \mapsto g(x)A_\mu(x)g(x)^{-1} + ig(x)\partial_\mu g(x)^{-1}, \quad (1.3)$$

so that  $D_\mu\psi(x) \mapsto g(x)D_\mu\psi(x)$ , while

$$F_{\mu\nu} \mapsto g(x)F_{\mu\nu}g(x)^{-1}, \quad (1.4)$$

leaving the action invariant.

The action of the theory in  $d + 1$  dimensions is the given by

$$S[A, \psi, \bar{\psi}] = \int d^{d+1} \mathcal{L} \quad (1.5)$$

and the path integral

$$Z = \int \mathcal{D}A \mathcal{D}\bar{\psi} \mathcal{D}\psi e^{iS[A, \psi, \bar{\psi}]}. \quad (1.6)$$

### 1.1.1 EUCLIDEAN FIELD THEORY

In order to work in a Euclidean space-time, we need first to perform a *Wick rotation*, where the time coordinate  $x_0$  is mapped a forth space coordinate  $x_4$ , through  $x_0 = -ix_4$ . The has the effect of changing the path-integral integrand from  $e^{iS}$ , which is oscillatory, to  $e^{-S}$ , which is positive and can be interpreted as a probability distribution of the configurations of the fields.

The Euclidean path integral is

$$Z_E = \int \mathcal{D}A \mathcal{D}\bar{\psi} \mathcal{D}\psi e^{-S}, \quad (1.7)$$

so that the Minkowski action and the Euclidean action satisfy  $iS_M = -S_E$ . The respective actions are given by

$$S_M = \int d^{d+1} x_M \mathcal{L}_M, \quad S_E = \int d^{d+1} x_E \mathcal{L}_E. \quad (1.8)$$

The rotation  $x_0 = -ix_4$  leads to  $\mathcal{L}_E = -\mathcal{L}_M$ .

The Wick rotation does not change the form of the gauge kinetic term, i.e.,

$$-\frac{1}{2g^2} \text{tr}(F_{\mu\nu} F^{\mu\nu}). \quad (1.9)$$

The sum is a simple Euclidean sum, where there are no minus signs when raising or lowering indices and  $\mu = 1, \dots, d + 1$ .

Considering now the fermionic part of the Yang-Mills Lagrangian, we need to perform the Wick rotation on the Dirac operator. In Minkowski space-time

$$\bar{\psi}(i\gamma_M^\mu D_\mu - m)\psi = \bar{\psi}(i\gamma_M^\mu \partial_\mu + \gamma_M^\mu A_\mu - m)\psi, \quad (1.10)$$

where  $\gamma_M^\mu$  are the gamma matrices of the Clifford algebra, and they satisfy  $\{\gamma_M^\mu, \gamma_M^\nu\} = 2\eta^{\mu\nu}$ . In the Euclidean Clifford algebra instead the gamma matrices  $\gamma_E^\mu$  satisfy  $\{\gamma_E^\mu, \gamma_E^\nu\} = 2\delta^{\mu\nu}$ . Given the fact that we have  $\partial_0 = i\partial_4$  and  $A_0 = iA_4$ , in order to obtain the correct form we have to put  $\gamma_M^0 = \gamma_E^4$ . This procedure yields

$$\bar{\psi}(i\gamma_M^\mu \partial_\mu + \gamma_M^\mu A_\mu - m)\psi = -\bar{\psi}(\gamma_E^\mu \partial_\mu + i\gamma_E^\mu A_\mu + m)\psi. \quad (1.11)$$

Since  $\mathcal{L}_E = -\mathcal{L}_M$ , we finally arrive at

$$\mathcal{L}_E = \frac{1}{2g^2} \text{tr}(F_{\mu\nu} F^{\mu\nu}) + \bar{\psi}(\gamma^\mu D_\mu)\psi, \quad (1.12)$$

where the indices are all Euclidean and  $D_\mu = \partial_\mu + iA_\mu$ .

### 1.1.2 HAMILTONIAN FORMULATION

The Hamiltonian formulation of a Yang-Mills theory can be tricky, especially the part about the gauge field. Usually, one has to proceed by computing the conjugate momenta and performing a Legendre transform. The main issue here is that the gauge field component  $A_0$ , does not have a conjugate momentum:

$$\frac{\partial \mathcal{L}}{\partial \dot{A}_0} = 0. \quad (1.13)$$

Hence, the transformation is not invertible. The easiest way to remedy to the situation is to impose the gauge condition  $A_0 = 0$ , which is called *canonical gauge* or *temporal gauge*. With this condition, the kinetic term for the gauge fields can be written as

$$\mathcal{L} = -\frac{1}{2g^2} \text{tr}(F_{\mu\nu} F^{\mu\nu}) = \frac{1}{g^2} (\mathbf{E}^2 - \mathbf{B}^2) = \frac{1}{g^2} (E_i^a E_i^a - B_i^a B_i^a), \quad (1.14)$$

where  $\mathbf{E}$  and  $\mathbf{B}$  are, respectively, the “chromoelectric” and the “chromomagnetic” fields. In the temporal gauge  $\mathbf{E} = \dot{\mathbf{A}}$ , the time derivative of the spatial components  $\mathbf{A}$  of the gauge field  $A_\mu$ , while  $\mathbf{B}$  corresponds to the spatial components of the strength-field tensor  $F^{\mu\nu}$  and does not involve any time derivative. From the Legendre transformation of (1.14) we obtain the Hamiltonian density:

$$\mathcal{H} = \frac{1}{g^2} E_i^a \dot{A}_i^a - \frac{1}{2g^2} (E_i^a E_i^a - B_i^a B_i^a) = \frac{1}{2g^2} \text{tr}(\mathbf{E}^2 + \mathbf{B}^2), \quad (1.15)$$

hence the Hamiltonian in  $d$  spatial dimensions is

$$H = \int d^d x \frac{1}{2g^2} \text{tr}(\mathbf{E}^2 + \mathbf{B}^2) \quad (1.16)$$
